

## Read Me

Here are a couple of steps that can make are code running:

1. First things first, you'll have to install Node.js, MongoDB and GIT installed in your system.
2. Now you need to run the following commands on your system  
`npm install -g bower grunt`
3. Now you need to navigate to project folder and enter the command:  
`grunt`
4. The project should be up and running, but if the app crashes or the project shows a blank page, that is generally because the angular is not included properly, in that case you may need to run the command:  
`bower install --allow-root`
5. Lastly, the twitter and linkedin handles are just for a demo, they are not working. If you get an object error while signing in through Facebook, just refresh the homepage and you'll have the project up and running.
